

ADVANCED AIR CLEANERS NEW RZR 900 AIR CLEANER SYSTEM

BY NOW EVERYONE KNOWS THE STOCK RZR 900 AIR CLEANER DOES NOT WORK. JEFF HOWE AT ADVANCED AIR CLEANER SYSTEMS HAS COME UP WITH A SOLUTION!

This is the Stock Air Filter just after a few rides, sand is already trying to make its way around the Filter, because of the Air Box Design that the Filter sits in.

The Stock Air Box has wing nuts to hold the Filter tight against the housing. The problem with this design is that there are two hinges at the bottom of the Air Box, this is the part of the Filter where the sand finds its way into the Motor. Another problem with this design is when you need to remove the Filter you can't help but contaminate the Air Box by the residue that falls off of the Filter.

I am not here to bag on Polaris, I believe they build awesome vehicles! It appears they have fixed this problem in the new RZR 1000. I admire this company because they continue to listen to their consumer's wants, needs, and suggestions to improve their product.

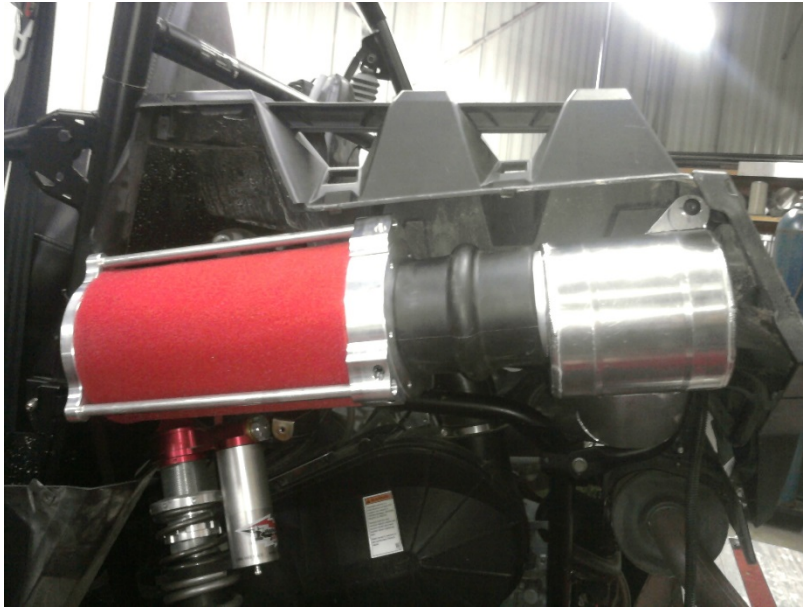

Jeff Howe at Advanced Air Cleaner has designed a complete System for the RZR 900's,
He started with building the Air Box to get the Air Filter away from the Motor.

This Air Box is constructed with two Velocity Stacks, allowing maximum performance.

Most people are not aware of the proper design for a Velocity Stack, the lip is always the over looked part. You may note in other Air Box designs where the Velocity Stack Lip does not roll under it is flat, the flat lip creates an air bubble, lessening the efficiency of the air flow. Our lip rolls under, allowing the air flow to be as smooth as possible. This will allow the Velocity Stack to have strong suction like a vacuum. The length of the Velocity Stack creates torque for the Engine.

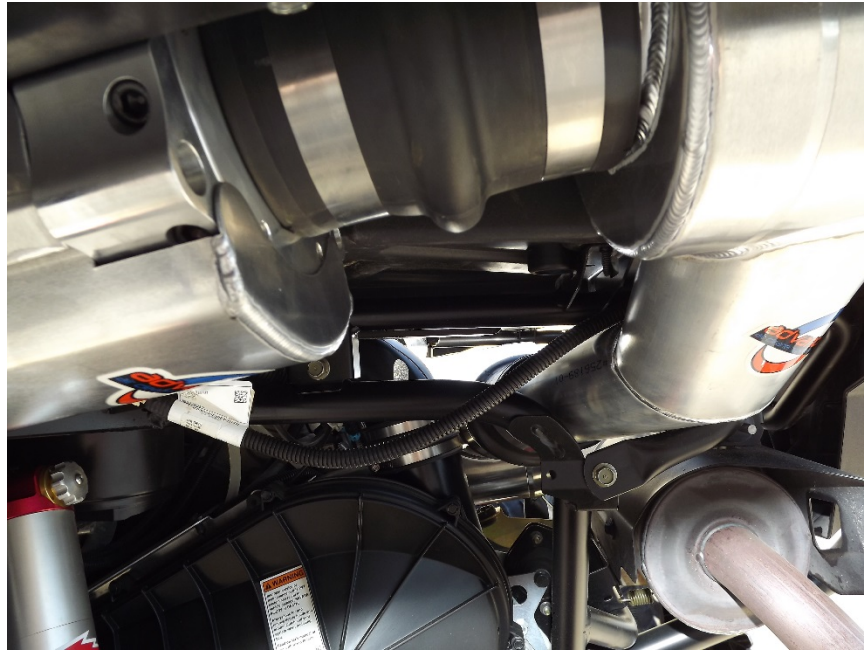

The Air Cleaner has been relocated above the driver side wheel well.

This is the same Filter that has been winning the Baja 1000 for over 30 years!

This Filter is designed to handle heavy duty silt. Advance Air Cleaners went over kill on the Filter to get years of use instead of just one Desert Season. Note that the Rods are on the outside of the Filter, instead of the inside, this is for maximum air flow.

The Air Cleaner is connected to the Air Box through our large 4" diameter Air Log.

The Filter is mounted through the cage of the RZR – bracket is included.

Next you need to cut the plastic body, a template is provided. Cutting into the body is very easy.

A scoop will cover the hole in the body, as seen in the images.

The RZR 900 Air Cleaner System was designed to have enough clearance for 32" tall tires.

SYSTEM INCLUDES:

Our Super Flow Air Cleaners are...
Better by Design
